

What's new in CIDEON Visual Reports 5.1.0.0

This document describes the main new features of CIDEON Visual Reports in version 5.1.0.0.

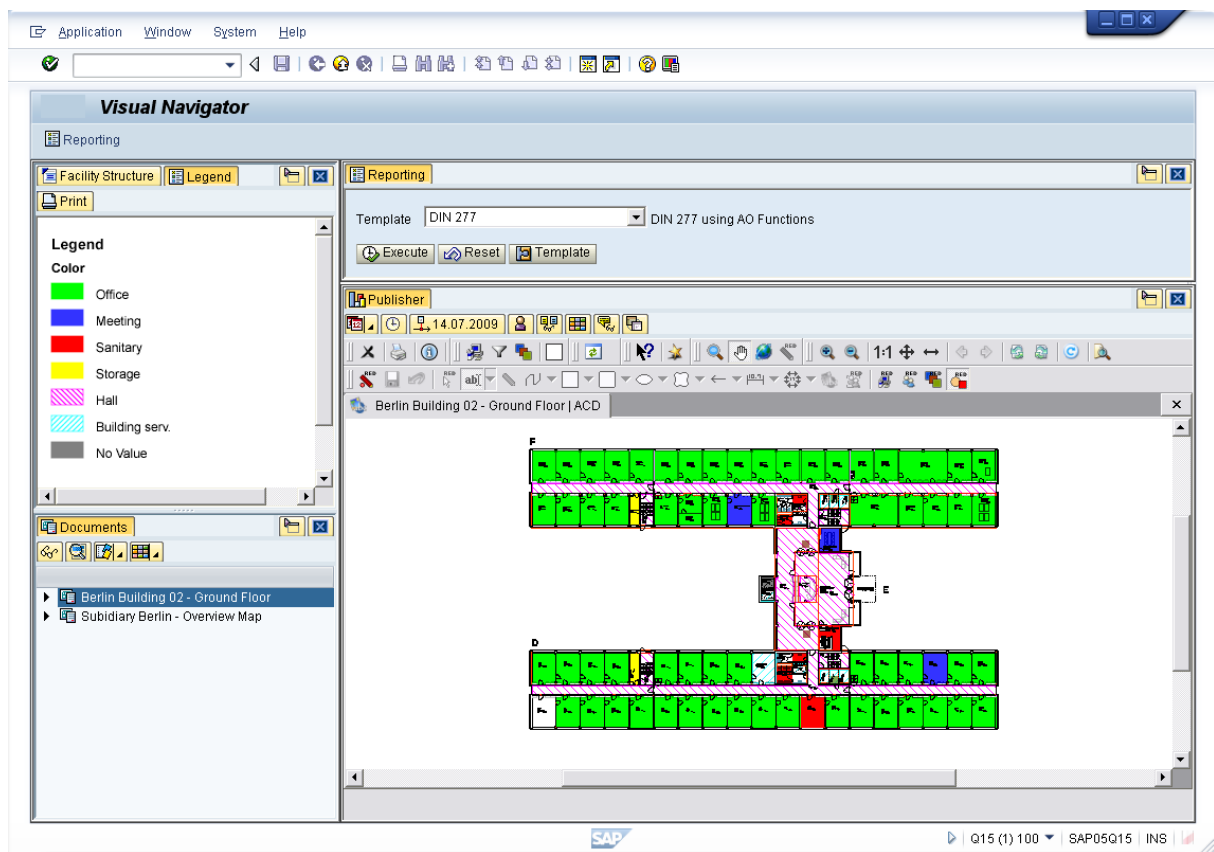

- Adhoc Queries
- Value groups
- Result Data Grid
- Handling of objects without value

Adhoc Queries

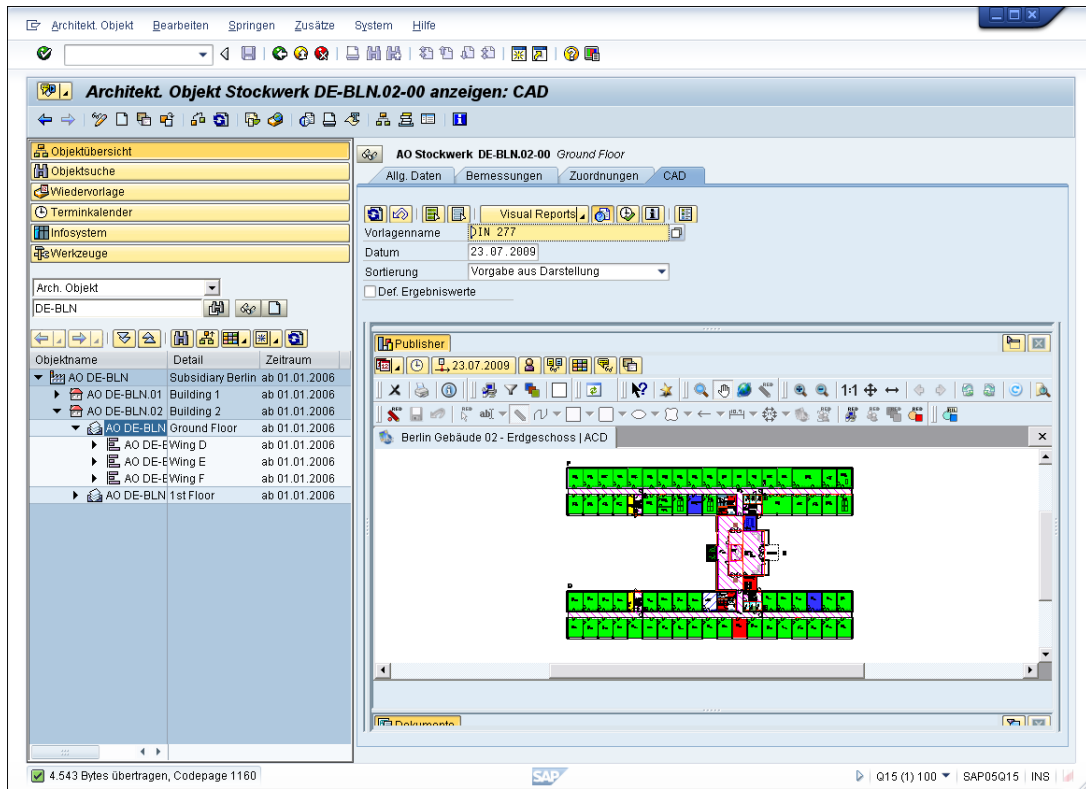

Did you ever want to simply carry out an evaluation of an open drawing, while using the CIDEON Visual Navigator or the SAP Real Estate Navigator? Now you can do this with the new Adhoc Queries.

In the Visual Navigator you click on the button "Reporting" in the application toolbar. Suggests the "Reporting" View will be displayed in the upper right.

Now you can one of the Templates defined in Visual Reports and immediately get graphical analyses including the relevant legend.

While using the SAP Real Estate Navigator, select from the query list "Visual Reports". Now you see the options known from Visual Reports variants. Select the relevant Template as well as the due date and run the query.

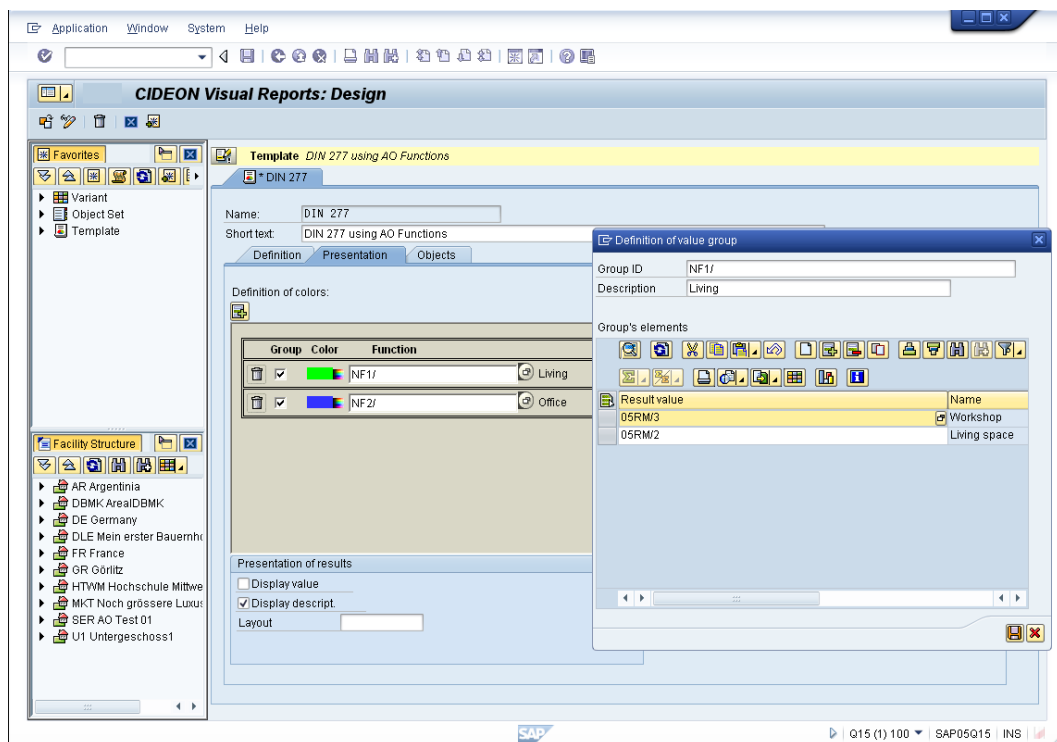

Value groups

Don't you think that some queries are just too accurate?

Would you like to summarize the results of a query, for example, several cost centers as organizational groups at a higher level?

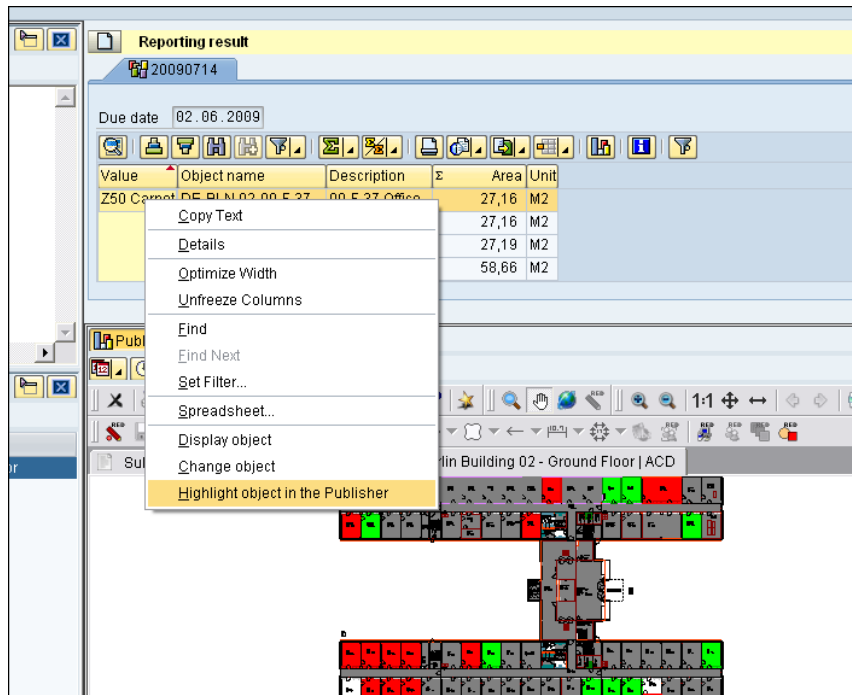

Therefore Visual Reports gives you the opportunity, while defining Templates, to summarize and create value groups rather than just individual values and assign colors the each group.

Result Data Grid

In order to see only objects inside the data grid, which are also visible on the current drawing in the Publisher, you can use this new feature. There is a button in the tables toolbar which switches between these two display options.

Furthermore objects (e.g. rooms) may be edited or highlighted in the drawing from within additional menu items in the tables context menu.

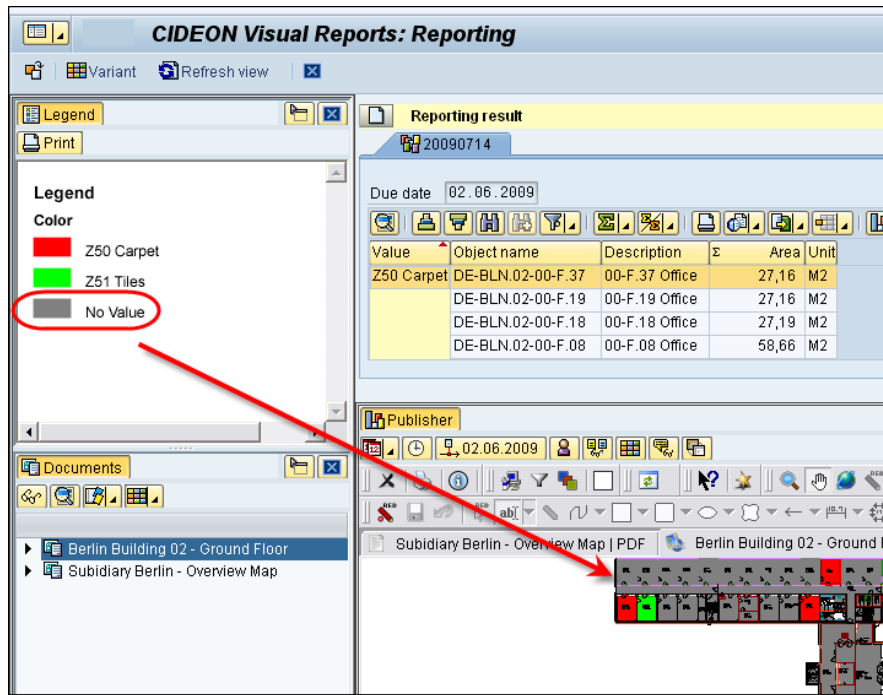

Handling of objects without value

In previous versions of Visual Reports the Evaluation Type has been responsible for handling objects with got no value for the evaluation criteria. This results in different representations of the results. Some reports ignored these objects.

With this release these objects are handled globally. In each report these objects are listed separately in the legend and data grid.

The customizing allows to define a unique color coding for objects without a value.

Beside these new features there are a lot of smaller improvements in Visual Reports 5.1.0.0.
