5

REASONS WHY

End-to-End Configuration: Configure More Efficiently, Deliver Faster, and Scale Customization

Customized products, short delivery times, and competitive prices are no longer differentiators – they are customer expectations. But meeting these expectations becomes increasingly difficult as product and process complexity grows. End-to-end digital processes can help. With Cideon Conify,

you create a foundation for efficient order engineering by standardizing and modularizing processes and connecting data across systems. This reduces manual effort, accelerates project execution, and supports consistent quality. Here are five reasons to consider Cideon Conify.

GLOBAL SUPPORT

1

Create a Consistent Data Structure Across Departments

Cideon Conify takes data from your product configurator and transforms it into a standardized structure for downstream processes. Information captured during sales can flow directly into engineering, purchasing, and manufacturing – reducing manual data transfers and rework. This saves time and helps prevent errors.

2

Generate PDM-Compliant Data for Easier Reuse

The MCAD/ECAD data generated by Cideon Conify is PDM-compliant, making it easier to manage and reuse existing parts and engineering data. Engineering teams can continue working with the generated data in their familiar environment – for example, when additional customer-specific engineering is required.

3

Keep CAD Data Structured and Accessible

Cideon Conify organizes CAD data in a structured way so teams can find and access the information they need. This helps maintain continuity throughout the project and makes it easier for new team members to pick up work when responsibilities change.

4

Connect PLM and ERP for Consistent Data Handoffs

Cideon Conify connects configuration and engineering processes with your PLM and ERP environment. Product master data and BOMs can be generated automatically and transferred to downstream processes consistently. This reduces manual data entry and helps keep product information consistent.

5

Connect the Process from Sales to Manufacturing

Cideon Conify connects systems and data across departments. Data captured early in the configuration process can be reused downstream instead of being entered or recreated multiple times. This reduces redundant work and helps move customer orders through the process faster.
